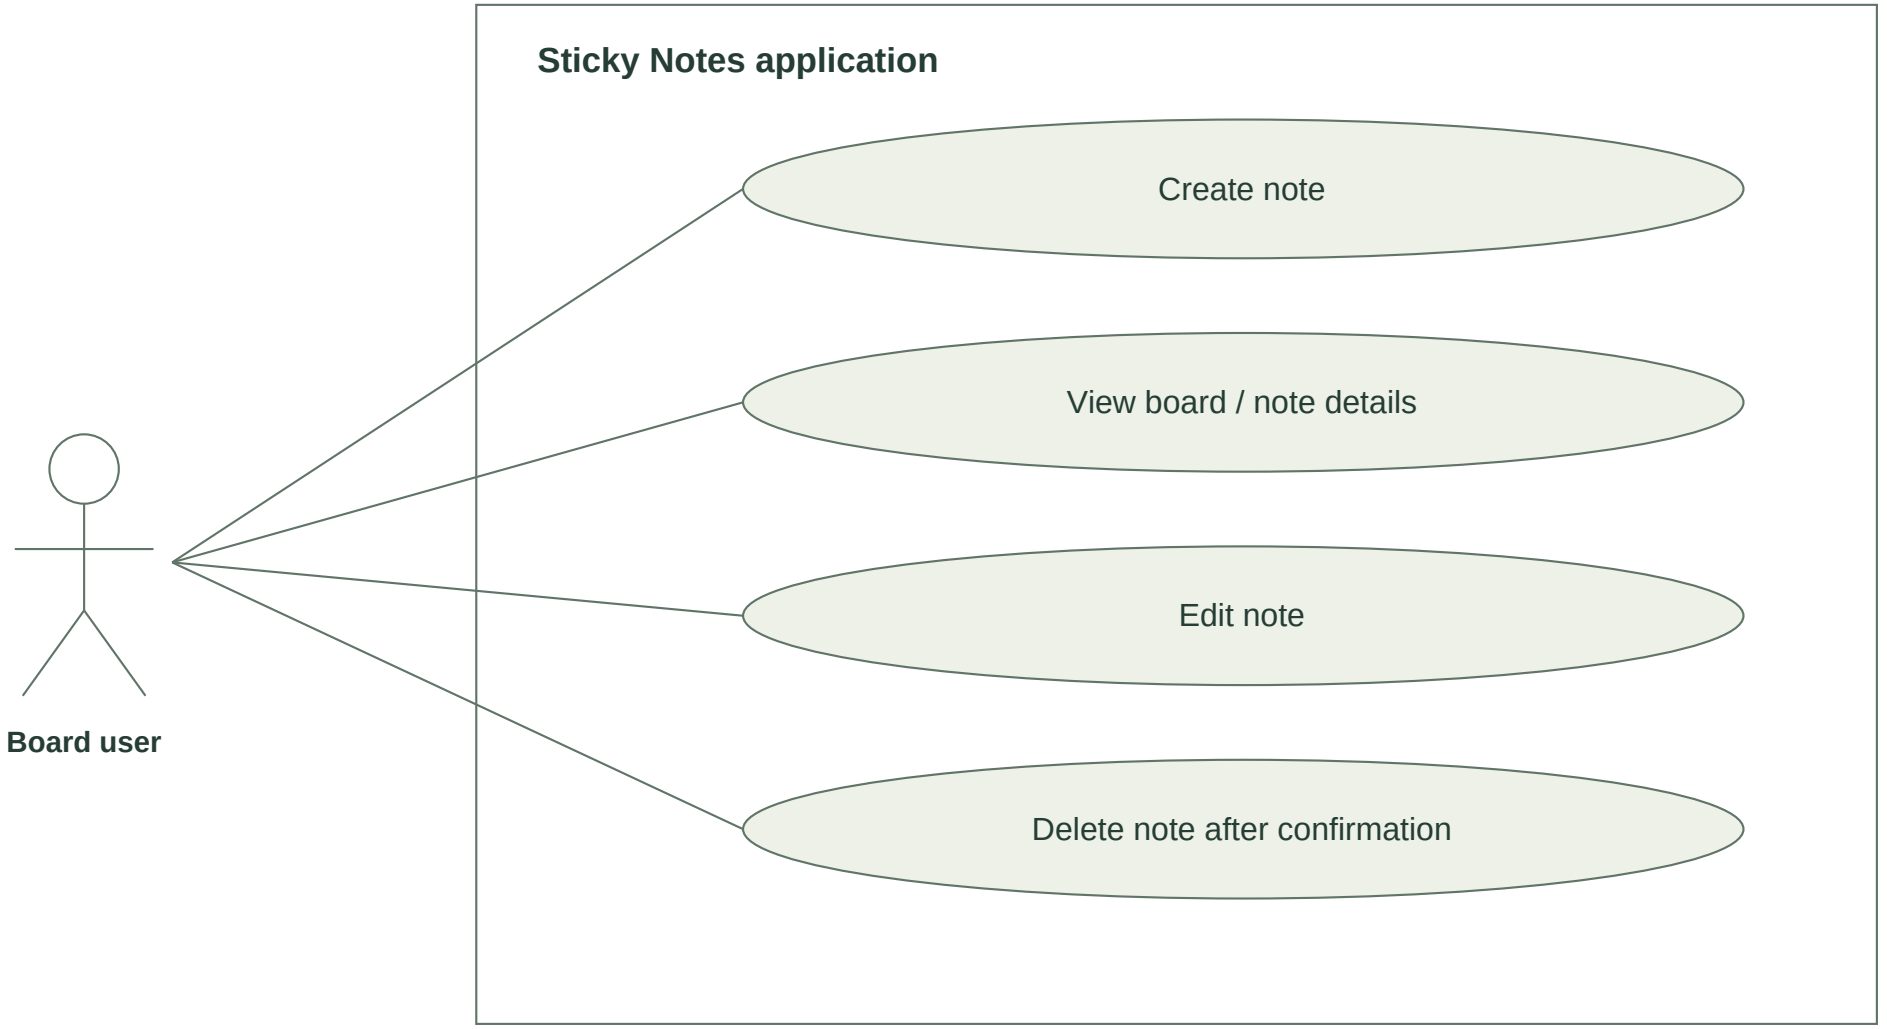
Use case diagram

Scope: a local shared notes board. Authentication is outside Part 1 app scope.



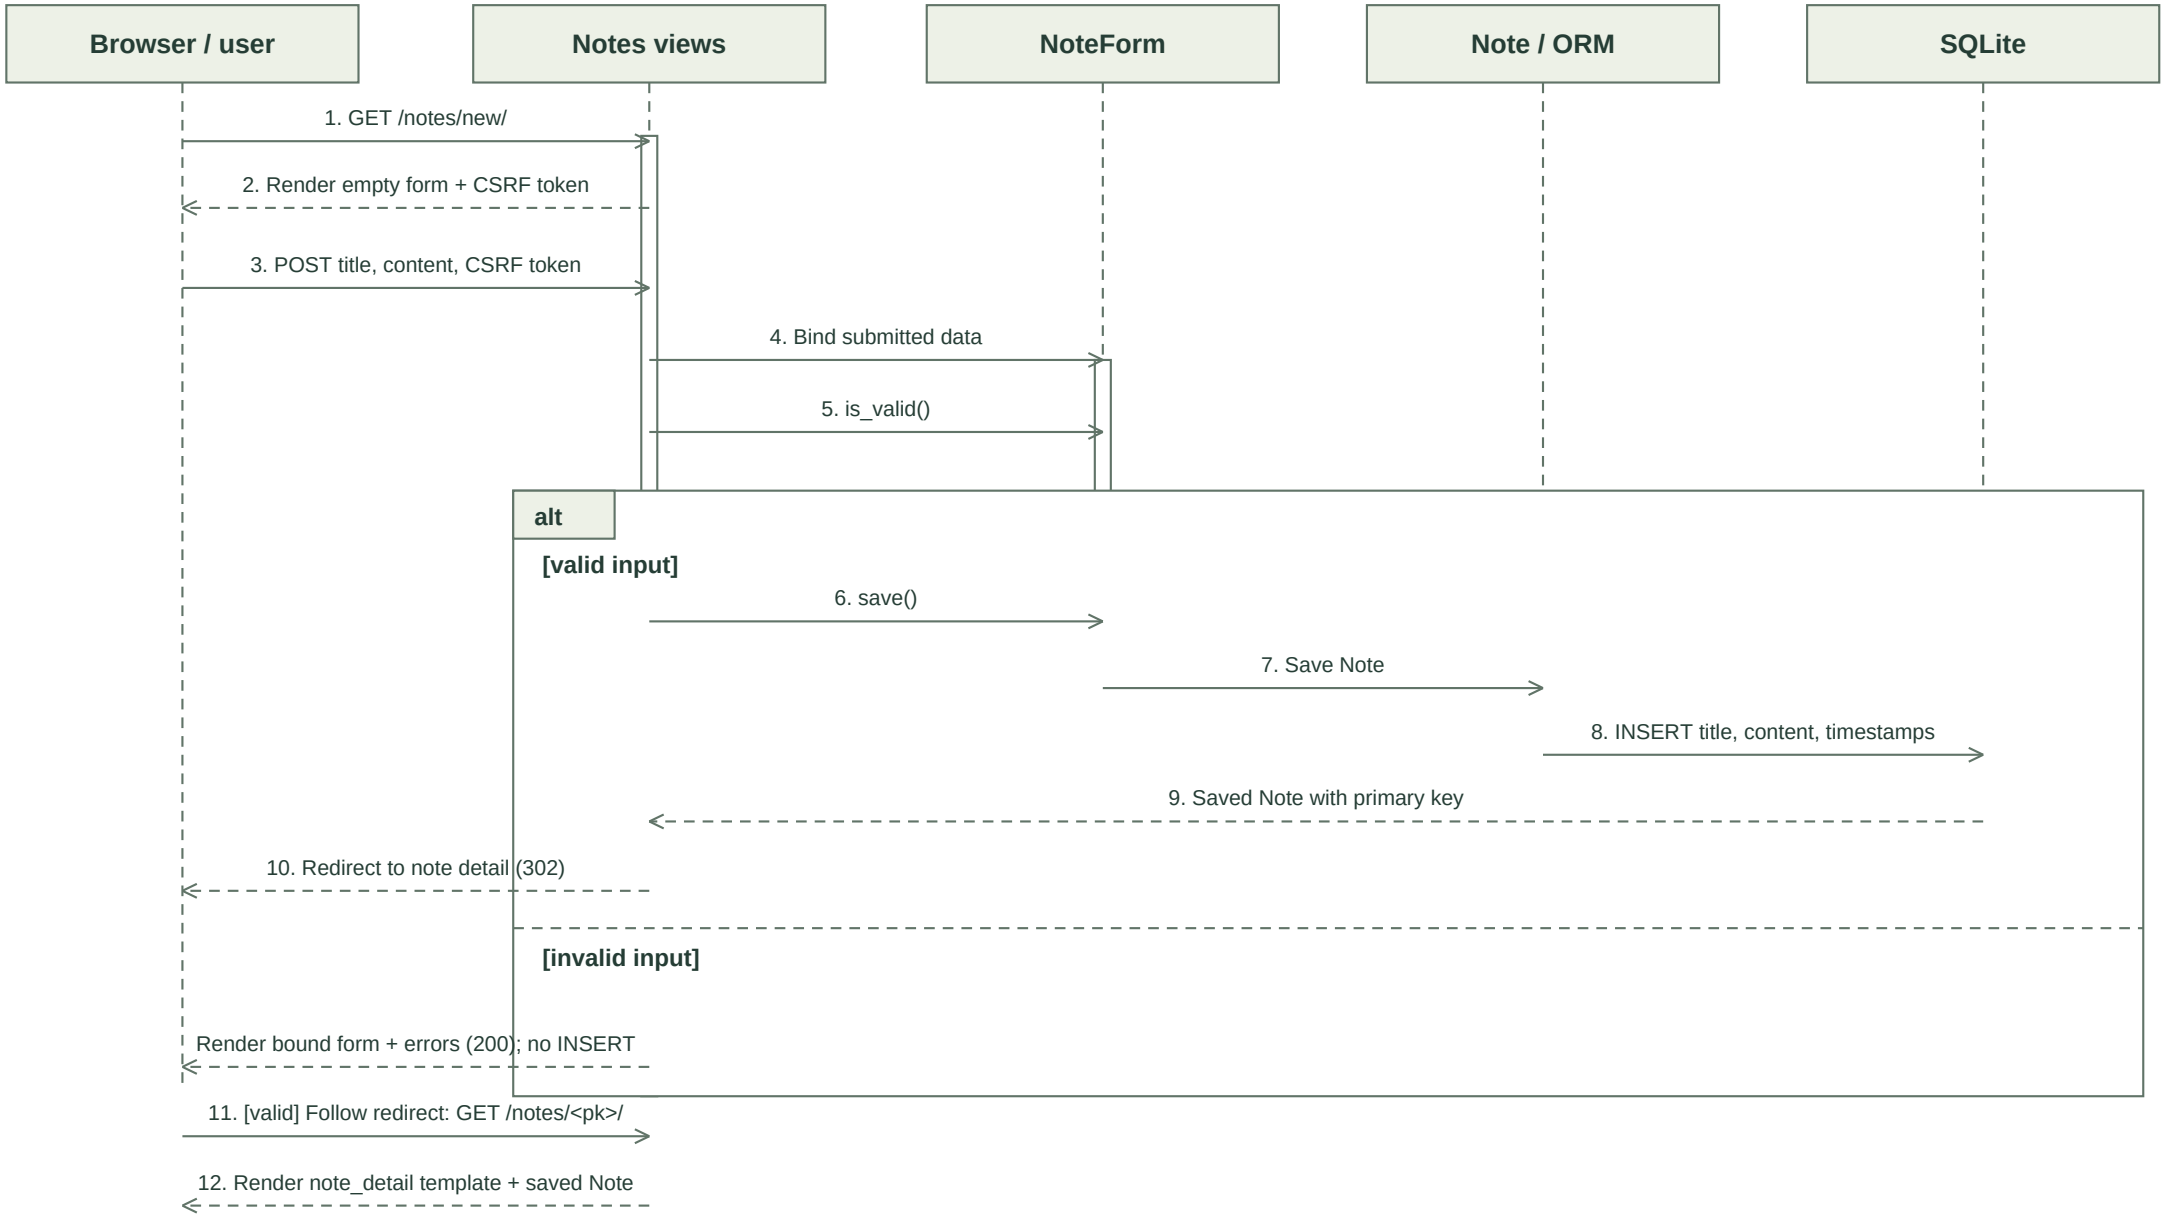
CRUD: Create note = C; View board / details = R; Edit note = U; Delete note = D.

Input is validated. Delete confirmation is read-only until a CSRF-protected POST is submitted.

Sequence diagram

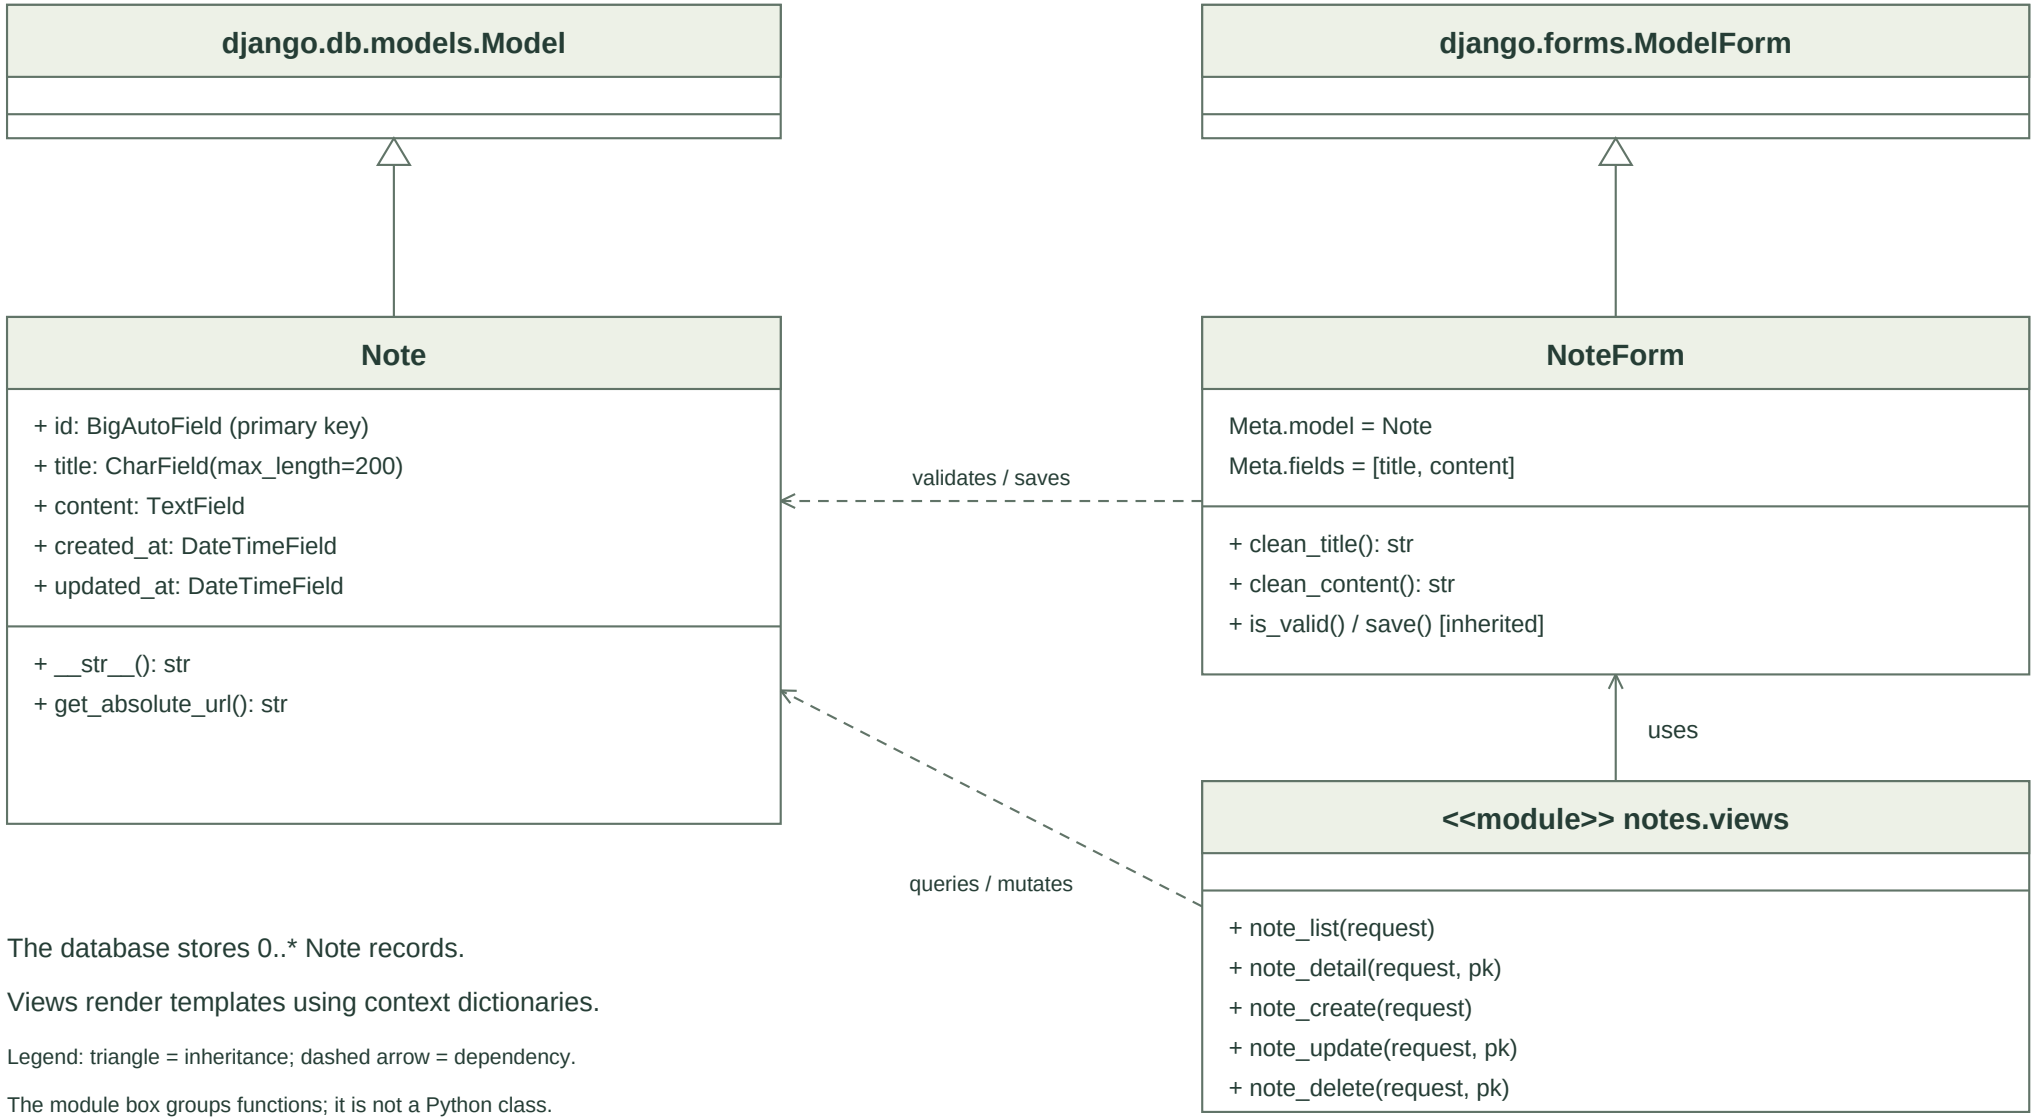
Representative create-note flow: browser -> view -> ModelForm -> ORM -> SQLite.

Django validates the CSRF token before the POST reaches the view.



Class diagram

Model and ModelForm inheritance, plus module dependencies used by function-based views.



The database stores 0..* Note records.

Views render templates using context dictionaries.

Legend: triangle = inheritance; dashed arrow = dependency.

The module box groups functions; it is not a Python class.
